

Mirror Mount Instructions

1. Attach your favorite mirror to the AirBim mount. Using the bolt hole provided on the mounts. Only snug up the mirror and do not fully tighten as you will be removing it in the below steps. Please note the bolt through hole is 8.45 mm round. We are showing a KemiMoto mirror found here. [Mirror Link](#)

2. Next lower your bimini to find the best placement for the mount. You should choose a spot on the rail that when the bimini is in the lowered position it does not hit any seating arrangement or your drive console. Once you have the spot selected, mark this spot with a pencil.
3. Now you can either leave your mirror on the mount or remove it. We find it easier to remove the mirror to put the mount on and in position.
4. Now let's raise the bimini to begin putting your mount on. With the bimini in the raised position, Wrap the provided gasket around the railing where you have marked the location with pencil. The gasket should meet close to the center as shown below. Then slide the lower half of the mount over the gasket.

5. Next place the upper half of the mount on the top and use the provided 4 bolts to tighten. Please note thread them in snug only and then use cross pattern tightening to begin to secure the upper half to the lower half. The mounts will come together nicely. Be careful to not overtighten the bolts.
6. The last step is to secure your favorite mirror to the mount and adjust the mirror as needed so you have a nice view while in the seated and driving position.
